

## 6. Endovascular aneurysm repair

### Length of procedure

**Figure 3.** Length of the procedure  $n=53$

The length of procedure was calculated from the time of the first angiogram to groin closure. As can be seen the reported length of endovascular repair was very variable with some cases being very prolonged.

Other interventions performed at the time of surgery included femoro-femoral crossover (3), internal iliac embolisation (3), additional cuff insertion (3), and other unspecified and infrequent procedures (4).
